Example:

A user registration feature might involve:

- A POST API endpoint to accept user data
- Data validation logic
- Saving data to MongoDB
- Sending back a response with user details or error messages

Frontend Development with React

React applications consume the backend APIs to present data to users. They are responsible for rendering views, managing user interactions, and updating the UI dynamically.

Workflow:

- Fetch data from backend using fetch or axios
- Manage application state (e.g., using React hooks or Redux)
- Render components based on data
- Handle user events such as clicks, form submissions

Example:

A login page might:

- Send login credentials to backend API
- Receive authentication token
- Update UI to reflect logged-in state

Mobile App Development with React Native

React Native apps connect to the same backend APIs used by the React web app, enabling code reuse and consistent data management across platforms.

Workflow:

- Use React Native components to build UI

- Fetch data from APIs similarly to React
- Manage state locally or with global state management solutions
- Access device features via native modules

Example:

A mobile app dashboard might:
